IN THE CLAIMS

The following listing of the claims is provided in accordance with 37 C.F.R.

1.121:

1-7. (Canceled)

8. (Currently Amended) A wash basket for a washing machine, the wash basket comprising:

a housing having an inner wall fabricated by a first process; and

a plurality of geometric structures fabricated by a second process, the plurality of geometric structures attached to and extending radially inwardly from the inner wall, the geometric structures comprising a separate structure relative to the housing, wherein a shape of the plurality of geometric structures is configured for reducing a residual moisture content of an article contained within the wash basket during a spin cycle.

9. (Original) The wash basket of claim 8 wherein at least one of the plurality of geometric structures has a bell-shaped cross section.

10. (Original) The wash basket of claim 8, at least one of the plurality of geometric structures comprising a first portion extending radially inwardly a first distance from the inner wall and a second portion extending radially inwardly a second distance from the inner wall where the first distance is greater than the second distance.

11. (Original) The wash basket of claim 8 further comprising:

a porous material covering at least a portion of at least one of the plurality of geometric structures.

Serial no. 10/741, 322
Response to Office Action mailed on January 12, 2007

12. (Original) The wash basket of claim 8 wherein at least one of the geometric structures is formed of a material sufficiently porous to wick a quantity of liquid away from an article contained in the wash basket during a spin cycle.

13. (Original) The wash basket of claim 8, the plurality of geometric structures comprising a plurality of spaced apart ribs.

14. (Canceled)

15. (Original) The wash basket of claim 8 wherein at least one of the plurality of geometric structures has an aperture formed therein.

16 (Currently Amended) A washing machine comprising:
a cabinet;
a wash basket rotatably mounted in the cabinet, the wash basket having a bottom and an inner wall; and
a plurality of geometric structures connected to the inner wall, the geometric structures extending radially inwardly from the inner wall, wherein a shape of the plurality of geometric structures is configured based on at least an operating parameter of the washing machine for increasing a volume of the wash basket and decreasing a residual moisture content of an article contained within the wash basket during a spin cycle.

17. (Original) The washing machine of claim 16 wherein at least two of the plurality of geometric structures are spaced apart about 1.25 inches from respective centerlines and at least one of the plurality of geometric structures extends radially inwardly of the wash basket about 0.625 inches.

18. (Canceled)

Serial no. 10/741, 322

19. (Original) The washing machine of claim 16 further comprising:
means for introducing air into the wash basket during a spin cycle.
20. (Original) The washing machine of claim 16 further comprising:
means for providing airflow along a central axis of an agitator during a spin.
21. (Original) The washing machine of claim 20, the means for providing
airflow along a central axis of the agitator during a spin cycle comprising a vent formed
in the cabinet and a duct for directing air from the vent to the central axis of the agitator.
22. (Original) The washing machine of claim 20 further comprising:
means for heating the airflow.
23. (Original) The washing machine of claim 16 further comprising:
a porous material covering at least a portion of a geometric structure for wicking a
quantity of water away from an article contained in the wash basket during a spin cycle.
24. (Original) The washing machine of claim 16 further comprising:
means for drawing air from the wash basket during a spin cycle.
25. (Currently Amended) An apparatus in a washing machine for extracting
liquid from an article when the apparatus is rotated about an axis, the apparatus
comprising:
a substantially cylindrical housing having an inner wall defining a height;
a geometric structure attachable to the housing; and
means for attaching the geometric structure to the inner wall, wherein the
geometric structure is configured to reduce a residual moisture content of the article
contained within the washing machine during a spin cycle.

Serial no. 10/741, 322
Response to Office Action mailed on January 12, 2007

26. (Original) The apparatus of claim 25, the housing further comprising:
a bottom; and
wherein the geometric structure is configured in an area of the housing that is less
than the height of the housing.

27. (Original) The apparatus of claim 26, the geometric structure comprising a
plurality of ribs.

28. (Original) The apparatus of claim 25, the geometric structure comprising
at least one geometric structure selected from the group of a linear rib and a nonlinear rib
and a semi-spherical protrusion.

29. (Original) The apparatus of claim 25 wherein the geometric structure has a
constant cross section and extends radially inwardly from the inner wall.

30. (Original) The apparatus of claim 25 wherein the geometric structure has a
bell-shaped cross section.

31. (Original) The apparatus of claim 25 wherein the geometric structure
extends radially inwardly from the inner wall between about 0.25 inches and 1.0 inch.

32. (Original) The apparatus of claim 25, the geometric structure comprising a
plurality of ribs, wherein a distance between at least two ribs is sufficient to prevent the
article from impinging the inner wall during a spin cycle.

33. (Original) The apparatus of claim 32 wherein at least one of the plurality
of ribs has an aperture formed therein.

Serial no. 10/741, 322
Response to Office Action mailed on January 12, 2007
Page 6

34. (Original) The apparatus of claim 25 wherein the geometric structure has an aperture formed therein.

35. (New) A washing machine comprising:
a cabinet;
a wash basket rotatably mounted in the cabinet, the wash basket having a bottom and an inner wall;
an agitator disposed in the wash basket and configured to agitate an article and a liquid in the wash basket; and
a plurality of rigid geometric structures fixedly attached to the inner wall of the wash basket and extending radially inwardly from the inner wall.

36. (New) The washing machine of claim 35, wherein the plurality of geometric structures are configured to reduce the residual moisture content of the article as a function of at least a height of the geometric structure, or a spacing between the geometric structures, or an orientation of the geometric structure, or combinations thereof.

37. (New) The washing machine of claim 35, wherein the geometric structures comprises ribs having a textured surface area for reducing the residual moisture content of the article.
